

74. Identificando al usuario autenticado con Laravel para crear una orden

En **OrderController**:

```
<?php
namespace App\Http\Controllers;
use App\Services\CartService;
use Illuminate\Http\Request;

class OrderController extends Controller {
    public $cartService;
    public function __construct(CartService $cartService) {
        $this->cartService = $cartService;
        $this->middleware('auth');
    }

    /**
     * Show the form for creating a new resource.
     *
     * @return \Illuminate\Http\Response
     */
    public function create() {
        $cart = $this->cartService->getFromCookie();
        if (!isset($cart) || $cart->products->isEmpty()) {
            return redirect()
                ->back()
                ->withErrors("Your cart is empty!");
        }
        return view('orders.create')->with([
            'cart' => $cart,
        ]);
    }

    /**
     * Store a newly created resource in storage.
     *
     * @param \Illuminate\Http\Request $request
     * @return \Illuminate\Http\Response
     */
    public function store(Request $request) {
        $user = $request->user();
        $order = $user->orders()->create([
            'status' => 'pending',
        ]);
        $cart = $this->cartService->getFromCookie();
        $cartProductsWithQuantity = $cart
            ->products
            ->mapWithKeys(function ($product) {
                $element[$product->id] = ['quantity' => $product->pivot-
>quantity];
                return $element;
            });
        $order->products()->attach($cartProductsWithQuantity->toArray());
    }
}
```

En orders/create.blade.php:

```
...
<h4 class="text-center"><strong>Grand Total: </strong> {{ $cart->total }}</h4>

<div class="text-center mb-3">
    <form
        class="d-inline"
        method="POST"
        action="{{ route('orders.store') }}"
    >
        @csrf
        <button type="submit" class="btn btn-success">Confirm Order</button>
    </form>
</div>

<div class="table-responsive">
...

```
